INSTRUCTIONS

- Use Font size 22 to 28 and Font Style Times New Roman (body)
- Do not change the Template: Heading / Title of the slides
- Do not change font style or colours
- Do not copy paste paragraphs: use only Bullet Points
- Maximum slide Limit is 20 only
- As per the number of supervisor allotted adopt slide-2 or slide-3
- Please display the required meaningful Content or images or tables
- Change the footer accordingly using insert tab then click on header & footer tab and edit it
- Save the PPT with Register No, Dept and Review no, example: 23xxxxxxxxx_CSE

Abstract

•The Automated Time-Driven Digital Notice Board System is a modern solution designed to replace traditional physical notice boards in colleges, offices, and apartments.

•It allows users to create and publish notices with details such as title, description, posted time, expiry time, and priority level (high, medium, low).

•The system automatically removes or archives expired notices, ensuring that only relevant and up-to-date information is displayed.

•Users can view notices directly on the website, making announcements easily accessible.

•The HTML module structures the website with components such as the header, notice board display area, notice submission form, and footer.

•The CSS and JavaScript modules handle the styling, priority highlighting, responsive layout, and functionalities like adding, deleting, editing, sorting, and searching notices.

Existing System

- Most institutions rely on traditional physical notice boards to display announcements.
- Notices are printed on paper and manually pinned to the notice board.
- Old and expired notices often remain on the board, creating clutter and confusion.
- People must physically visit the notice board to check for updates or new announcements.
- Managing and updating notices is time-consuming and requires manual effort.
- There is no automatic system to organize notices based on priority or time.
- Important announcements can be missed easily due to overcrowded or poorly managed notice boards.

Proposed System

- The proposed system introduces a web-based automated digital notice board to display announcements online.
- Users can create and publish notices with details such as title, description, posted time, expiry time, and priority level.
- The system automatically removes or archives expired notices to keep the notice board updated.
- Notices can be viewed easily through the website from any location with internet access.
- The system allows sorting of notices based on priority and time for better organization.
- Users can search and filter notices to quickly find relevant information.
- The digital system improves communication efficiency and reduces the use of paper-based notices.

System Architecture

- **Presentation Layer (User Interface Layer)**
- Provides the interface through which users interact with the system.
- Displays product information, stock details, and system outputs.
- Allows users to perform operations such as adding, updating, searching, and viewing inventory records.
- Ensures a simple and user-friendly interaction with the system.
- **Application Layer (Business Logic Layer)**
- Processes user requests and manages the core functionality of the system.
- Implements inventory management logic such as product updates, stock validation, and data processing.
- Handles communication between the user interface and the data storage layer.
- Ensures proper execution of inventory operations and system rules.
- **Data Layer (Database Layer)**
- Responsible for storing and managing all inventory-related data.
- Maintains records such as product details, stock quantities, and inventory updates.
- Ensures secure data storage and efficient retrieval of information.
- Supports data integrity and consistency within the system.

.

Project Modules

- **User Interface Module**
  Provides an interactive interface for users to access the digital notice board.
  Allows users to easily navigate, view notices, and interact with system features.
- **Notice Management Module**
  Allows users to add, edit, delete, and view notices.
  Maintains notice details such as title, description, posted time, expiry time, and priority level.
- **Channel Management Module**
  Enables creation and management of different channels for various groups or departments.
  Allows users to join channels and view notices specific to that channel.
- **Notice Monitoring Module**
  Automatically checks notice expiry time and removes or archives expired notices.
  Ensures that only active and relevant notices are displayed on the board.
- **Data Management Module**
  Stores and manages notice-related information within the system.
  Ensures accurate storage, retrieval, and consistency of notice data.

Objectives

•To design and develop an Automated Time-Driven Digital Notice Board System using HTML, CSS, and JavaScript.

•To replace traditional paper-based notice boards with a digital and automated platform.

•To allow users to create and manage notices with details such as title, description, priority, and expiry time.

•To automatically remove or archive expired notices to keep information updated.

•To enable users to easily view announcements through the website anytime.

•To improve communication efficiency and ensure quick access to important information.

Co’s Attainments - FWD

- **CO1**
- Understand Internet fundamentals, HTTP/HTTPS protocols, and web client-server architecture.
- Explain browser functionality, developer tools, web hosting, and domain concepts.
- Apply HTML document structure and basic webpage elements such as lists, links, and images.
- **CO2**
- Design structured web pages using HTML forms, semantic tags, tables, and media elements.
- Apply CSS styling techniques including selectors, typography, colors, and spacing.
- Implement modern layout techniques using Flexbox, CSS Grid, and responsive design.
- **CO3**
- Apply JavaScript fundamentals including variables, operators, conditions, loops, and functions.
- Work with arrays, objects, and ES6 features for efficient programming.
- Implement functional programming concepts such as arrow functions and callbacks.
- **CO4**
- Perform DOM manipulation and event handling to create dynamic web pages.
- Use browser storage such as localStorage and sessionStorage for client-side data.
- Implement asynchronous programming using Promises, fetch(), async, and await.
- **CO5**
- Implement form validation and API integration using JavaScript.
- Apply performance optimization techniques and SEO practices for web applications.
- Deploy responsive and interactive web applications with improved usability.

Co’s Attainments - DSA

- **CO1**
- Analyze problem statements using asymptotic notation (Big-O, Ω, Θ).
- Compare algorithm efficiency based on time and space complexity.
- Implement and evaluate searching and sorting algorithms in Java.
- **CO2**
- Design and implement Abstract Data Types (ADTs) using arrays and linked lists.
- Perform operations such as insertion, deletion, searching, and traversal.
- Evaluate advantages and limitations of different data structures.
- **CO3**
- Apply stacks and queues to solve real-world workflow problems.
- Implement circular queues, deques, heaps, and priority queues.
- Analyze performance compared to other linear data structures.
- **CO4**
- Design hash-based data structures using hashing techniques.
- Implement hash tables with chaining and open addressing.
- Utilize Java Collections (List, Queue, Deque, Map) for efficient solutions.
- **CO5**
- Develop practical applications using linear data structures.
- Implement data structures to solve real-world computational problems.

Screenshots for FWD

```html
<!DOCTYPE html>
<html>
<head>
<meta charset="UTF-8">
<title>Multi-Channel Digital Notice Board</title>

<link rel="stylesheet" href="style.css">

</head>

<body>
```

Co1 :
- HTML structure
- Meta tags
- Linking CSS

```html
<form id="noticeForm">
<input type="text" id="title" placeholder="Title">
<textarea id="description"></textarea>
<input type="datetime-local" id="expiry">
<select id="priority">
<option value="high">High</option>
<option value="medium">Medium</option>
<option value="low">Low</option>
</select>
<button type="submit">Post Notice</button>
</form>
```

Co2 :
- Forms
- Input fields
- Dropdown

```javascript
const notice = {
id: Date.now(),
title: title.value,
description: description.value,
expiry: expiry.value,
priority: priority.value
};
```

Co3 : Shows JavaScript objects.

```javascript
const channelList = document.getElementById("channelList");

const btn = document.createElement("button");
btn.textContent = channel;
channelList.appendChild(btn);
```

Co4 : DOM creation,
Dynamic elements

```javascript
setInterval(renderNotices, 30000);
```

Co5 : automatic updates / performance control.

Conclusion

- The Automated Time-Driven Digital Notice Board System provides an efficient solution for managing and displaying notices digitally.
- The system automates posting and removal of notices, reducing manual effort and keeping information updated.
- It allows users to easily create, view, and manage notices with important details.
- The user-friendly interface ensures quick access to announcements through the website.
- The system improves communication and ensures only active notices are displayed.
- Future improvements may include user login, real-time notifications, and database integration.
